General Description

The MT1401 family, produced with CMOS technology. The Hall IC internally includes an on-chip Hall voltage generator, a voltage regulator for operation with supply voltages of 3.0 to 18V, temperature compensation circuitry, small-signal amplifier, Hall sensor with dynamic offset cancellation system, Schmitt trigger and an open-drain output.

They are designed to respond to alternating North and South poles. While the magnetic flux density(B) is larger than operate point (B_{OP}), the output will be turned on (Low), the output is held until the magnetic flux density(B) is lower than release point (B_{RP}), then turn off (High).

The MT1401 family provides a variety of packages to customers: SOT-23/SOT-89B for surface mount and flat TO-92 for through-hole mount. All packages are RoHS compliant.

Definition of Magnetic Parameters

B_{OP} : Operating Point, Magnetic flux density applied on the branded side of the package which turns the output driver ON ($V_{OUT}=Low$)

B_{RP} : Release Point, Magnetic flux density applied on the branded side of the package which turns the output driver OFF ($V_{OUT}=High$)

B_{HYST} : Hysteresis Window, $|B_{OP}-B_{RP}|$

Electrical and Magnetic Characteristics

Absolute Maximum Ratings

Absolute maximum ratings are limiting values to be applied individually, and beyond which the serviceability of the circuit may be impaired. Functional operability is not necessarily implied. Exposure to absolute maximum rating conditions for an extended period of time may affect device reliability.

Absolute maximum ratings: all voltages listed are referenced to GND.
