

1 Product Description

The MagnTek® MT9523 product series is a fully integrated Hall Effect-based isolated linear current sensor device family designed for AC or DC current sensing in industrial, commercial, and communications systems. Each of the MT9523 consists of a precise, low-offset, linear Hall circuit with a low-resistance current conductor path located near the surface of the die. Applied current flowing through this low-resistance current conductor path generates a magnetic field that the Hall IC converts into a proportional voltage. The current is sensed differentially in order to reject common-mode fields, improving accuracy in magnetically noisy environments. Device accuracy is optimized through the close proximity of the magnetic field to the Hall transducer.

A precise, proportional voltage is provided by the low-offset, chopper-stabilized CMOS Hall IC, which has been accurately calibrated when it is manufactured. The output of the device has a positive slope (>VOQ) when an increasing current flows through the primary current conduction path (from pins 1 and 2, to pins 3 and 4). The internal resistance of this conductive path is 1.0 mΩ typical, providing low-power loss. The terminals of the conductive path are electrically isolated from the signal leads (pins 5 through 8). This allows the MT9523 current sensor IC to be used in high-side current sense applications without use other costly isolation techniques.

The MT9523 family provides SOP-8 package to customers, The package is RoHS compliant.

Not to scale

2 Features

- AEC-Q100 Qualified
- ±0.3% Typical Linearity Over Temperature
- Fast Output Response Time: 2.2 μs (typ.)
- 250kHz Signal Bandwidth
- 5.0V/3.3V Power Supply Operation
- Output Mode Option:
 - Ratiometric Output Proportional to Power Supply
 - Fixed Output Out of Proportion to Power Supply
- -40°C~150°C Operating Temperature
- Primary Conductor Resistance
 - 1.0mΩ
- Sensing Current Range: (AC or DC)
 - ±5A, ±10A, ±15A, ±20A, ±25A, ±30A, ±40A, ±50A
 - +10A, +20A, +30A
- Output Voltage Proportional to AC or DC Current
- Extremely Stable Quiescent Output Voltage
- Non-Ratiometric Operation with Reference Output
- Near Zero Magnetic Hysteresis
- Safety Parameters: (UL62368: US72227128 01)
 - 2.5kVrms 1min Dielectric Surge Isolation
 - 450Vrms, 636VDC or VPK Working Voltage
 - 4mm Clearance Distance
 - 4mm Creepage Distance
- Package Option:
 - SOP-8
- RoHS Compliant: (EU)2015/863

3 Applications

- Medium and low power inverter current sensing
- Motor phase and rail current sensing
- Micro PV inverter
- Chargers and Converters
- EPS
- PTC heater
- DC-DC
- Overcurrent Protection

9 Typical Application Circuit

- (1) CBYPASS=0.1uF, **CBYPASS between VCC and GND is necessary**; CL, CL_VZCR recommended 0.47nF.
- (2) The "Zero Current Reference Output" can use either single ended output or differential output to interface with ADC or OPA.

10 Electrical Magnetic Characteristics

10.1 Absolute Maximum Ratings

Absolute maximum ratings are limited values to be applied individually, and beyond which the serviceability of the circuit may be impaired. Functional operability is not necessarily implied. Exposure to absolute maximum rating conditions for an extended period of time may affect device reliability.

Symbol	Parameters	Min	Max	Units
VCC	Supply Voltage	-	6	V
VRCC	Reverse Battery Voltage	-0.1	-	V
VOUT	Output Voltage	-	VCC+0.5	V
VROUT	Reverse Output Voltage	-0.1	-	V
IOUT(source)	Continuous Output Current	-	40	mA
IOUT(sink)	Continuous Output Current	-	40	mA
TA	Operating Ambient Temperature	-40	150	°C
TS	Storage Temperature	-50	150	°C
TJ	Junction Temperature	-	165	°C

10.2 Isolation and Package Characteristics

Symbol	Parameters	Test Conditions	Value	Units
V _{SURGE}	Dielectric Surge Strength Test Voltage	Tested ±5 pulses at 30 seconds in compliance to IEC 61000-4-5 1.2 / 50 μs (width).	6000	V
V _{ISO}	Dielectric Strength Test Voltage	Test method per UL standard 60950-1 (edition 2). V _{TEST} = V _{ISO} , t = 60 s (qualification); V _{TEST} = 1.2 × V _{ISO} , t = 1 s (100% production)	2500	V _{rms}
V _{IOWM}	Maximum Working Isolation Voltage	Maximum working isolation voltage according to UL60950-1	636	V _{PK} or V _{DC}
			450	V _{rms}
CTI	Comparative Tracking Index	Comparative tracking index according to IEC60112:2009	550	V
D _{CL}	External Clearance	Measured from input terminals to output terminals, shortest distance through air.	4	mm
D _{CR}	External Creepage	Measured from input terminals to output terminals, shortest distance path along body.	4	mm

10.3 Life Time Characteristics

Symbol	Parameters	Test Condition	Min	Typ	Max	Unit
ESNST_DRIFT	Sensitivity Error Lifetime Drift	TA=-40~125°C	-3	-	3	%
ETOT_DRIFT	Total Output Error Lifetime Drift	TA=-40~125°C	-3	-	3	%

* Based on characterization data obtained during AEC-Q100 stress testing.

10.4 ESD Ratings

Parameters	Reference	Grade
Human-body model (HBM)	AEC-Q100-002	Class IIIA
Charged-device model (CDM)	AEC-Q100-011	Class C3
Latch up	AEC-Q100-004	Class IIA

10.5 Electrical Specifications

TA = -40~150 °C, VCC=3.0~5.5V, CBYPASS=0.1uF (unless otherwise specified)

Symbol	Parameters	Test Condition	Min	Typ	Max	Unit
VCC	Supply Voltage	XXBR5, XXBF5	4.5	5	5.5	V
		XXBR3, XXBF3	3.0	3.3	3.6	V

11 Characteristic Definitions

Power On Time---TPO

When the supply is ramped to its operating voltage, the device requires a finite time to power its internal components before responding to an input magnetic field.

The Power-On Time (TPO) is defined as the time taken between the supply reaching the minimum operating voltage V_{CCmin} (t_1), and the output voltage to settling to within $\pm 10\%$ of its steady state value under an applied magnetic field (t_2) (See Figure 5).

Figure.5 Power On Time Definition

Propagation Delay---TPD

The time interval between a) when the primary current signal reaches 20% of its final value, and b) when the output reaches 20% of its final value (see Figure 6).

Figure.6 Propagation Delay Definition

Rise Time---TR

Rise Time is the time interval between the sensor V_{OUT} reaching 10% of its full scale value (t_1), and it reaching 90% of its full scale value (t_2). (see Figure 7). Both T_R and T_{RESP} can be negatively affected by any eddy current losses created if a conductive ground plane is used.

Figure.7 Rise Time Definition

Response Time---TRESP

The time interval between a) when the primary current signal reaches 80% of its final value, and b) when the sensor reaches 80% of its output corresponding to the applied current. (see Figure 8). Both T_R and T_{RESP} can be negatively affected by any eddy current losses created if a conductive ground plane is used.

Figure.8 Response Time Definition

Zero-Current Output Voltage---VOQ

VOQ is the voltage output when the primary current is zero. For Ratiometric mode, the bidirectional device is $0.5 \times VCC$ and the unidirectional device is $0.1 \times VCC$ when the primary current is zero. For Fixed mode, the bidirectional device is 2.5V or 1.65V and the unidirectional device is 0.5V or 0.33V, when the primary current is zero.

Ratiometric Mode:

When $VCC=4.5V$, $VOQ=1/2 \times VCC$, $VOQ=2.25V$

Fixed Mode:

When $VCC=4.5 \sim 5.5V$, $VOQ=2.5V$

Zero-Current Reference Voltage---VZCR

MT9522 provides two different zero current reference voltage output (VZCR), one is the voltage reference output independent of the supply voltage (BF / UF), and the other is the voltage reference output proportional to the supply voltage (BR / UR). Users can know the output voltage corresponding to zero current through VOUT and VZCR. At the same time, it allows users to use either single ended output measurement or differential measurement

Ratiometric Mode:

When $VCC=5.5V$, $VZCR=1/2 \times VCC$, $VZCR=2.75V$

Fixed Mode:

When $VCC=4.5 \sim 5.5V$, $VZCR=2.5V$

Sensitivity---SNST

The Sensitivity in mV/A indicates how much the output changes when the primary current changes. It is the product of the magnetic circuit sensitivity (G/A) ($1G = 0.1mT$) and the linear IC amplifier gain (mV/G). The linear IC amplifier gain is programmed at the factory to optimize the sensitivity (mV/A) for the full-scale current of the device.

$$SNST = \left(\frac{VOUT_IPOSx - VOUT_INEGx}{IPOSx - INEGx} \right)$$

where IPOSx and INEGx are two current values with opposite polarities.

Zero-Current Output Error---

VOE (VOQ-VZCR)

The deviation of the device output from its ideal quiescent due to nonmagnetic causes. To convert this voltage to amp, divide by the device sensitivity (SNST).

Total Output Error---ETOT

The accuracy represents the maximum deviation of the actual current output from its ideal current value. This is equivalent to the difference between the actual output voltage and the ideal output voltage, divided by the ideal sensitivity, relative to the current flowing through the primary conduction path:

$$ETOT(IP) = \left(\frac{VOUT_IP - VOUT_ideal(IP)}{SNST_ideal \cdot IP} \right) * 100\%$$

Nonlinearity Sensitivity Error---ELIN

Ideally the primary current vs sensor output function is a straight line. The non-linearity is an indication of the worst deviation from this straight line. The ELIN in % is defined as:

$$ELIN = \left(\frac{SNST_I1}{SNST_I2} - 1 \right) * 100\%$$

Where:

$$SNST_I1 = \left(\frac{VOUT_IPOS1 - VOUT_INEG1}{IPOS1 - INEG1} \right)$$

$$SNST_I2 = \left(\frac{VOUT_IPOS2 - VOUT_INEG2}{IPOS2 - INEG2} \right)$$

and IPOSx and INEGx are positive and negative current values, with respect to the quiescent voltage output such that $|IPOS2| = |INEG2| = IPRmax$, and $|IPOS2| = 2 \times |IPOS1|$ and $|INEG2| = 2 \times |INEG1|$.

**Power Supply Rejection Ratio VOQ---
PSRR_VOQ**

It is defined as 20 × log of the ratio of the % change the VOQ over the % change in VCC reported as dB in a specified frequency range.

$$PSRR_VOQ=20 \lg \left| \frac{\Delta VOQ}{\Delta VCC} \right|$$

For Example:

When VCC changes from 5V to 4.5V (i.e. change - 500mv), VOQ changes from 2.5V to 2.505V (i.e. change 5mV), then

$$PSRR_VZCR=20 \lg \left| \frac{5}{-500} \right| = -40dB$$

**Power Supply Rejection Ratio VZCR---
PSRR_VZCR**

It is defined as 20 × log of the ratio of the % change the VZCR over the % change in VCC reported as dB in a specified frequency range.

$$PSRR_VOQ=20 \lg \left| \frac{\Delta VZCR}{\Delta VCC} \right|$$

For Example:

When VCC changes from 5V to 5.5V (i.e. change 500mv) and vzcr changes from 2.5V to 2.497V (i.e. change - 3mV), then

$$PSRR_VZCR=20 \lg \left| \frac{-3}{500} \right| = -44.437dB$$

**Power Supply Rejection Ratio SNST---
PSRR_SNST**

It is defined as 20 × log of the ratio of the % change the SNST over the % change in VCC reported as dB in a specified frequency range.

$$PSRR_SNST=20 \lg \left| \frac{\Delta SNST\%}{\Delta VCC\%} \right|$$

For Example:

When VCC changes from 5V to 4.5V (i.e. change - 10%), the sensitivity changes from 100mV / A to 99.9mv/a (i.e. change -0.1%), then

$$PSRR_SNST=20 \lg \left| \frac{-0.1\%}{-10\%} \right| = -40dB$$

Ratiometry Error---ERAT

For ratiometric mode, this means that the zero-current voltage output (VOQ) and sensitivity (SNST) are proportional to the supply voltage (Vcc). In other words, when the supply voltage increases or decreases by a certain percentage, each characteristic also increases or decreases by the same percentage. The error is the difference between the measured change of power supply voltage relative to 5V or 3.3V and the measured change of each characteristic

Ratiometry Quiescent Voltage Output Error---ERAT_VOQ

ERAT_VOQ, for a given supply voltage, is defined as:

$$ERAT_VOQ(5V)=\left(\frac{VOQ(VCC)/VCC}{VOQ(5V)/5V}-1\right)*100\%$$

$$ERAT_VOQ(3.3V)=\left(\frac{VOQ(VCC)/VCC}{VOQ(3.3V)/3.3V}-1\right)*100\%$$

Ratiometry Sensitivity Error---ERAT_SNST

ERAT_SNST, for a given supply voltage, is defined as:

$$ERAT_SNST(5V)=\left(\frac{SNST_I1(VCC)/VCC}{SNST_I1(5V)/5V}-1\right)*100\%$$

$$ERAT_SNST(3.3V)=\left(\frac{SNST_I1(VCC)/VCC}{SNST_I1(3.3V)/3.3V}-1\right)*100\%$$

Power-On Reset---POR, Undervoltage Lockout---UVL

The descriptions in this section assume temperature = 25°C, no output load (RL, CL) , and no significant magnetic field is present.

Power-Up. At power-up, as VCC ramps up, the output is in the following power supply voltage state. When VCC exceeds VPORH, the chip will enter the handshake protocol state. When VCC exceeds VUVLH, the output will go to 1/2*VCC or 2.5V, at this time, the chip is in normal working state.

Power-Down. If VCC drops below VUVLL, the output will be in a high-impedance state. If VCC drops below VPORL, the output is in the following power supply voltage state (See Figure. 9).

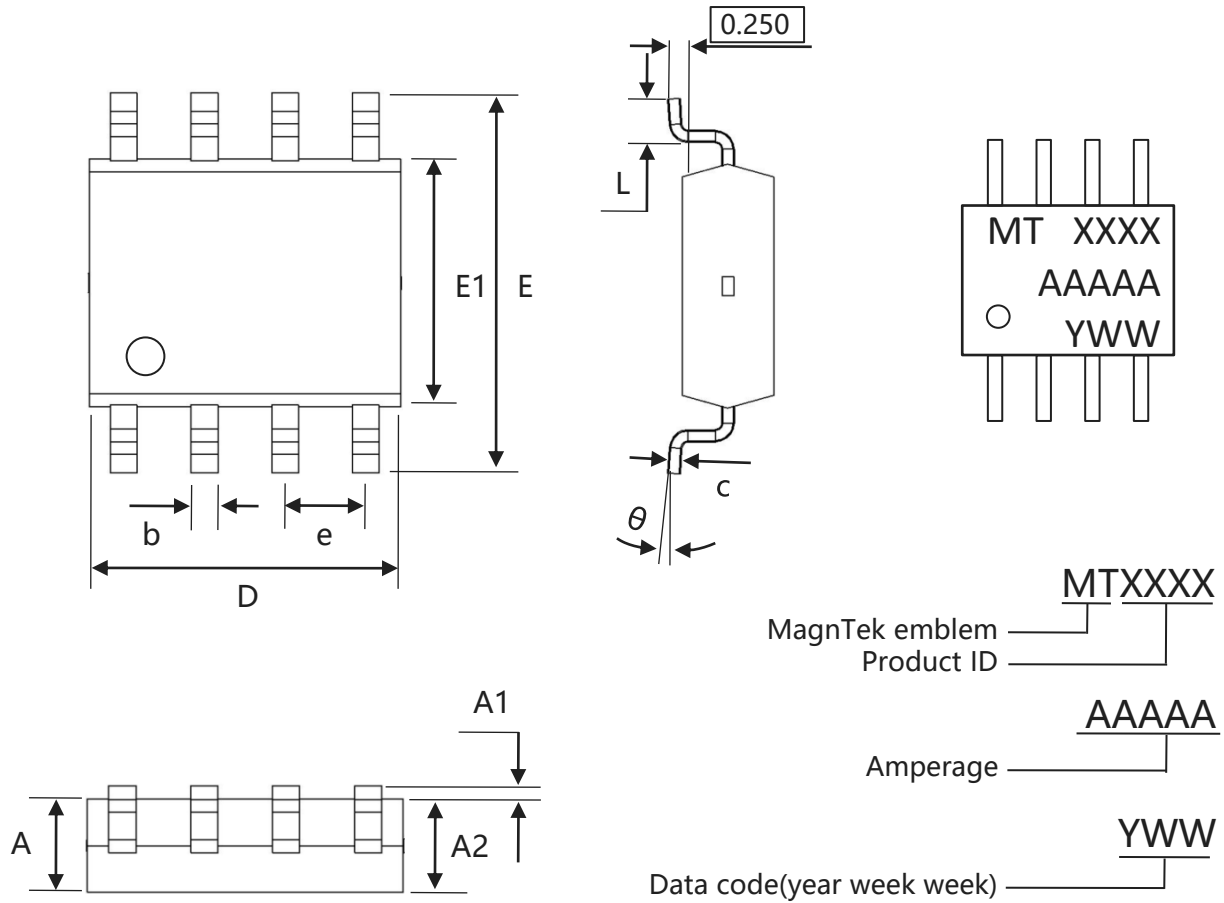

Figure.9 POR and UVL Definition
